

For the attention of RISCOS Users

DrawAid is an easy-to-use Wimp interface allowing a Library of Basic drawing procedures to be called by simple (or complex) User's Basic programs. From these User programs complex Drawfiles may be generated and displayed without any knowledge of the RISCOS Wimp. The application can be used to produce mathematically or parametrically defined drawings and can produce a sequence drawfiles from the one program. See the manual for full details.

The first version of DrawAid was written in 1991, and it has received steady development up to the present version 3.33 in November 2006. This last version has been slightly modified to run under the VirtualAcorn\* emulators on Windows PC machines. The drawfiles generated can be accepted by the XaraXtreme\* graphics package for further manipulation and enhancement.

The DrawAid application and procedure manuals in pdf format are contained in the file DrawAid/zip. This file can be unzipped with SparkPlug or InfoZip on RISCOS machines or it can be copied as the zipped file into the HardDisc4 folder on a PC with VirtualAcorn emulator and then unzipped inside the emulator.

This software is made available for use under free licence, but remains the property and copyright of the CARVIC Manufacturing. ie it is classed as 'Freeware' and may be copied freely, but not altered in any way. Additional, user generated, drawing procedures may be added to the Library for individual use, but must not be included in the freeware distribution copy, which must remain as in this zipped file.

This software is made available freely, "as is" with no warranty of fitness for any purpose and without any author support being available.

For The latest information and conditions see the !Help file in the DrawAid application. Also check the Library directory for additiona undocumented procedures.
